

PLAYOUT/ – MASTER CONTROL

DOC NO. RL-Z0-PLAYOUT-A REV. A RIPOSTE LABORATORIES

Runs on the 24/7 machine at home (a mini PC, or a homelab box – see `docs/self-hosting.md`). ErsatzTV turns the media library into a linear channel; the uplink carries it to the tower; the now-playing bridge tells the storefront what's on.

FILE	PURPOSE
<code>compose.yml</code>	The whole home side in one file – ErsatzTV + uplink + (optional) now-playing bridge
<code>ersatztv.sh</code>	Start just ErsatzTV in docker (pick your hardware-encoder tag)
<code>nowplaying.py</code>	The live marquee: reads ErsatzTV's guide, writes the current program into Owncast's title
<code>graphics-elements/</code>	The on-air overlays – bug, weather card, up-next, crawl. Deploy to ErsatzTV's <code>/config/templates/graphics-elements/</code> (manual <code>RL-Z0-WEATHER</code>)
<code>z0-uplink.service</code>	Bare-metal alternative to the compose uplink: <code>systemd ffmpeg -c copy</code> relay

SEC.01

QUICK START (CONTAINERIZED)

BASH

```
cp ../.env.example .env          # fill in real values
docker compose up -d             # ersatztv + uplink
docker compose --profile nowplaying up -d  # ...and the live marquee
```

The `uplink` service replaces `z0-uplink.service` – use whichever you prefer; don't run both. Media library layout: run `tools/make-media-tree.sh` to create it, and see `docs/build-guide.md` Phase 2 for the `schedule/filler` configuration.
